Define which system processes manage message traffic 3

Define which system processes manage message traffic

Follow these steps:

1. Click **System Administration** > **Base System Configuration** > **Miscellaneous** > **System Information Record**.
2. Click the **Message Processors** tab.
3. In the **Processor Name** field, type the names of the background or scheduler processes that are to manage message traffic. The processor name must match the class name specified for the message class processor.
4. Click **Save**.
5. Start the message processors.

Service Manager rotates messages among all the processes you define. If you don't define any message processors, then Service Manager uses the problem processor to manage all message traffic.
